

## Safeguarding your interests

Ensuring the safety of people while they are working on roofs has become standard procedure in recent years. When such work takes place regularly, it is worth considering the advantages of permanent fall protection in the form of guardrails. This is a safe yet flexible and easy solution that provides safety for an unlimited number of workers.

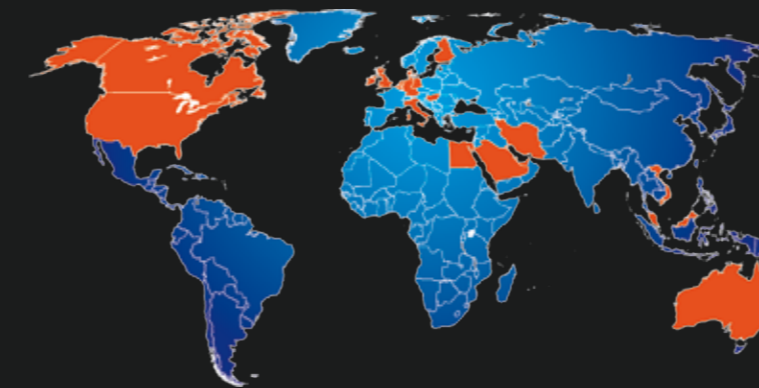

### Challenging roofs

There are many challenges when designing guardrails: the rails must have the flexibility to adjust to any shape of roof, must not spoil a building's beauty or damage a roof structure, and yet be robust, reliable and, of course, 100% safe. XSPlatforms has designed a range of guardrails that meet all these requirements and more.

The result: guardrail systems that provide maximum safety with a minimum amount of effort.

## Access to Innovation

In over fifteen years, XSPlatforms has built up a convincing track record in developing smart solutions for facade access. We offer the widest range of products and solutions. What is more, our customers can confidently expect us to understand their business, and to come up with innovative answers to increasingly complex questions, time and again. As a result, we have become the partner of choice for so many discerning customers, providing solutions for some of the most complex structures around the world and facilitating work on more than 2,000 roofs (and counting). We care for our customers, in every sense. And that is why we develop and engineer our products as though our lives depended on them.

Products are currently distributed in more than 22 countries

Fall Protection

Building Maintenance Units

Suspended Platform Systems

Scaffolding Systems

Suspended Access Rental

Dealer/distributor:

The XSPlatforms Fall Protection system complies with current standards and requirements: NEN-EN 13374 and OSHA 1926.502. Always read installation and user manuals before using our products. Restrictions may apply.

Permanent  
peace of mind

## Fall Protection

### Safe

Guardrail systems provide collective safety: no matter how many people are at work on a roof or how often: you always enjoy the peace of mind that comes with permanent, reliable fall protection. XSPlatforms' guardrail systems are fully certified, maintenance-free and extremely durable.

### Easy to install

Installing XSPlatforms guardrail systems could not be easier. It takes little effort and hardly any time. The main components simply click into place without the use of tools. The free-standing design also means there is no need to fix rails to the roof. Free-standing in this case does not mean less safe: the long base, supported by concrete counterweights, ensures perfect stability.

### Elegant

Guardrail systems are highly visible, so extra attention to design is vital if they are not to spoil architectural qualities. XSPlatforms has risen to this challenge: our guardrail systems stand out for their elegant design, high-quality materials and the possibility of reducing their visibility. For example, by folding them down when they are not needed or by using inclined guardrail posts.

### Durable

XSPlatforms guardrails are made of aluminium, which fully protects them against the elements and the risk of corrosion and gives them an extremely long lifespan. They are maintenance-free and do not require periodic inspections.

## Maximum security and minimal impact

XSPlatforms guardrails are available in three designs: a straight upright, a curved upright or an inclined upright construction. The curved and inclined designs provide extra collective fall protection (by keeping people further away from the edge of the roof). They may also add to the building's aesthetic value through their interplay with the lines and shapes of the building's design.

Maximum security and minimal impact on a building's architectural design? If you want guardrails to be visible only when they are actually needed, XSPlatforms has the solution: foldable guardrail systems.

XTP-Flex: guardrails folding upright

XTP-Mass: counterbalance

XSPlatforms guardrail systems have been designed to prevent damage to the roof structure. The guardrails are free-standing and can be installed without having to drill a single hole. They are not in direct contact with the roof covering, which reduces the risk of leakage or damp intrusion to an absolute minimum.

More and more customers prefer permanent fall protection in the form of guardrail systems. These provide collective safety: the ideal solution if more than two people regularly work on a building's roof. XSPlatforms guardrail systems are certified to EN 2001/45/CE.

## The benefits of XTP-Guardrail

- The ideal solution if more than two people regularly work on a building's roof
- Easy installation: two people can install 200-300 metres a day
- The XTP-Guardrail system is maintenance free, patented and certified to NEN-EN 13374
- The guardrails are free-standing and can be installed without having to drill a single hole into the roof, thus reducing to an absolute minimum the risk of leakage or damp intrusion
- Our guardrail system stands out for its elegant design, high-quality materials and the possibility of reducing its visibility
- A straight upright and a curved upright construction, available in a permanent and a foldable version
- The XTP-Guardrail products are made of high-grade aluminium and concrete
- The main components simply click into place without the use of tools

Safety considerations apply not only to the people who enjoy the protection of a guardrail system, but also to those who install them. XSPlatform's innovative design, in which the horizontal elements can be clicked into place (rather than having to be fed through a series of posts), makes for quicker, easier and ultimately safer installation.
